| 1.0     | 28/06/2021 | Final version for submission                   |

# 1.Executive Summary

The Use Case Description and Requirements report gives a detailed overview of the main use cases and the requirements associated with them. It includes the personae, the user scenarios and the workflows.

SELMA's central concept is to build a deep-learning NLP platform that trains unsupervised language models, using a continuous stream of textual and video data from media sources and make them available in a user/topic-oriented form in over 30 languages.

The knowledge learnt from deep contextual models is transferred to a set of NLP (Natural Language Processing) tasks and made available to users through a **Media Monitoring Platform** (Use Case 1) that will be able to handle up to ten million news items per day. The media monitoring platform will be able on demand to transcribe, translate, aggregate, write abstractive summaries, classify, and extract knowledge in the form of entities, relations and topics and present all this to the user using new visualizations and analytics over the data. The contextual models will also be applied to a **News Production Tool** (Use Case 2), where enriched models for transcription (ASR) and translation (MT) will be used. This will give journalists in an operational editorial environment a multilingual tool that will be able to learn continuously over time.

## 2.Introduction

This document describes the use case definition and user requirements for the SELMA project, which covers two use cases: a media monitoring platform and a news production tool, and several use case applications within those areas.

It includes the definition of the use cases which will serve as a basis for the personae, workflows and scenarios. User and technical requirements alongside the Key Performance Indicators (KPI) are extracted from the previous sections.

This deliverable contains 8 sections: the definition of the use cases, the description of personae, the workflow diagrams, the scenarios, the user and technical requirements, the KPIs and finally, the conclusion.

## 3. Use Case Description

We look at two main use cases, i.e., Media Monitoring and News Production, as well as four use case applications covered within those two principal use cases. The use case applications, in which the technologies and components developed in the project will be implemented, focus on specific challenges and direct usage in the media industry.

### 3.1 Media monitoring

The *Media Monitoring* use case focuses on the observation of web feeds with media content. In most cases, these are RSS feeds or website site maps which give access to written articles, video and audio content in multiple languages.

The user selects from available feeds and assigns them to a group, saved for easy reference and subsequent use. This allows the system to aggregate the media items contained in these groups. For each group, an automatic analysis identifies clusters of media items that are related by topic and other common attributes. This provides a visualization of the contained topics and entities along various facets, for instance how a cluster evolves over time or how gender is distributed.

An important feature is that the clustering works independently of the language, which means that related media items can be linked with each other across multiple languages.

The results of the analysis can be visualized in dashboards and used to trigger alerts. The results are also available via an API for post-processing.

#### 3.1.1 Advanced Content Analysis

This use case application covers advanced analysis of topics of journalistic content and summarization, which require more research. This may include a wide range of topics and themes.

##### 3.1.1.1 *Broadcast Monitoring and Analysis*

#### ***Goal***

The goal is to enhance internal and external monitoring and analysis activities based on real-life requests from within the broadcast (in particular DW) community, using advanced SELMA research results.

### **Concept**

During the project, DW will apply the SELMA platform to monitor broadcast material, from DW internal sources as well as from other news providers. This covers ingestion and processing of massive data streams, with video, audio and text, including feeds in all 30+ languages from DW. Advanced content analysis supports a more efficient editorial workflow and decision-making process through better information on trending topics and breaking news. It is a major step forward towards breaking the language barrier, as awareness of and access to content from different languages brings the different language departments within DW (and by extension different communities) closer together. In addition, ad hoc, specific analysis requests will be done based on topics of interest reported by DW users, e.g. elections or high-profile events, statements or actions by specific politicians. NLP technology enabling high-quality, reliable filtering and clustering, resulting in cross-language summarized reports allows our editorial staff to work at a next level in a fully customized way.

#### 3.1.1.2 Diversity

DW proposes to analyze journalistic content with respect to diversity, a major topic of interest, high on the agenda in the media as well as in the society. It is a complex analysis, thus well-suited for advanced analysis applications.

### **Goal**

Media needs and wants to be representative in their journalistic output.

*“An editorial team loses credibility if it doesn't represent diversity in its many forms: gender, ethnicity, sexual orientation, disability and different world views. Credibility is the most important currency in journalism.”* (Peter Limbourg, Director General Deutsche Welle)

We intend to improve diversity and representation in media by counting numbers and appearances with the help of Text Mining and NLP. This will be done in 30+ languages (using machine translation), covering the range of DW languages.

### **Concept**

We will measure both text and audiovisual content, published on [dw.com](http://dw.com) and beyond. The table below indicates the range of content targeted for this analysis.

*Table 1: Targeted content for the diversity analysis*

| # | What (representation)  | How (technology)   | Description, Examples   |
|---|--|--|---|
| 1 | <p>Quantity</p> <p>Representation of dimensions in media</p> <ul style="list-style-type: none"> <li>• Gender (Woman, Man, "Diverse")</li> <li>• BIPOC (black, indigenous and people of color)</li> <li>• People with disability</li> <li>• Age Groups</li> <li>• Sexual Orientation</li> <li>• Social Background</li> </ul> <p>Representation in specific roles</p> <ul style="list-style-type: none"> <li>• as interview partners</li> <li>• as experts</li> <li>• as moderators</li> </ul> | <p>Named Entity, NLP, Speaker Diarization, Speaker Recognition</p> | <p>In Germany, people with international backgrounds are 25% of the population. But in news coverage they hardly appear.</p> <p>Some dimensions will be easier to identify than others (e.g. first names give quite an indication of the assumed gender). Other dimensions might only be made recognizable by looking at context, e.g. such as: "is a non-binary artist", "is a gay activist" or "is focused on accessibility".</p> |
| 2 | <p>Quality / Semantics</p> <p>What are people talking about?</p>   | <p>Topic labeling, Topic clustering</p>                            | <p>Content analysis: Clustered along journalistic categories such as: politics, science, culture, sports, ...</p> <p>Example: Right or wrong? Do men only talk about beer and cars? Do women only talk about beauty and clothes?</p>  |

|   |   |   |  |
|---|---|---|--|
| 3 | General Diversity Topic Analysis<br><br>How often are diversity topics addressed? | Topic labeling,<br><br>Topic clustering | Gendered and diversity topics:<br><br>Gender, Feminism, Racism, Colonialism, Ableism |
|---|---|---|--|

Automatic reporting will make the analysis output available in the form of summarizations and graphical visualizations.

### 3.1.2 Press Agency Analysis

#### ***Goal***

This use case application, led by Priberam, targets a particular user set of Media Monitoring platform users, Press Agencies (PRs). Typically, these users serve a set of clients, operating in different areas of business.

#### ***Concept***

To specify the monitoring activities, the user sets their preferences, which may include which topic areas should be monitored (specific entities/organizations, different topics - sports, politics, economy, etc.), which sources can be shown in their original languages, and which should be displayed in English (default) or another chosen language. All these settings are saved in a so-called “View” - in other words: how you look at things - which can be reviewed and adapted at any time in a dedicated area.

Based on these settings, the system provides search results and other visualizations which the user can view either as a larger cluster or as individual items. Both clusters and items can be edited or adapted while working with them: users can mark items as favorites, save or curate them, provide feedback to the system, mark them as read or unread, get translations or put them through the fact checking process. These adaptations and configurations are used to train the system to improve following activities of the monitoring process.

Based on all these activities, the user can produce various outputs, like reports, dashboards, etc., and translate them into any desired language supported by the system. These outputs can either be shared internally, e.g. with colleagues or the head of department who had asked the analyst or journalist to do the monitoring, or they can be exported to pdf to share with clients.

## 3.2 News production

The *News Production* use case uses the NLP technologies that are developed in the project to support the creation of media content. The focus lies on the creation of text (summaries for newsletters and video subtitles) and synthesized speech (video voice-over and audio podcasts).

In all cases, the Media Monitoring component can provide input material. This is especially true for the newsletter scenario, where relevant news material needs to be identified and summarized first.

However, it is also possible to upload input material directly into the system for further processing. This is especially true for the video subtitling and video voice-over scenarios, where it is sometimes necessary to process hand-selected videos. It also applies to the Podcast translator scenario, where selected podcasts are translated into other languages using speech synthesis.

We will experiment with different user interfaces to collect user corrections of the corresponding SELMA components. We will also experiment with the UI to show the automated post-processing suggestions (in WP3) and to accept or reject user suggestions, including hints on how the correction should be used for learning (e.g. topic-dependent, one-time only, global). We will explore how to benefit from user suggestions at multiple levels – (1) on the document level, the UI should show corrections based on user correction of terms in the same file and (2) on the user level, for other documents edited by the same user and (3) globally to improve the overall suggestions to all users.

### 3.2.1 News Podcast Creation

This section proposes a use case application where audio news bulletins are produced with the support of SELMA. This use case application is optional and “system should be able to” wording in this section should be interpreted as optional functionality.

#### **Goal**

This use case application is based on a workflow observed in DW's Brazilian language department. The goal is to increase the workflow's efficiency by supporting the journalist in the production of daily audio news bulletins through SELMA.

The Reuters Digital New Report for 2020 highlights the rise of popularity of news podcasts over the last two years. One of the most well-known daily news podcasts is *The Daily* by the New York Times which attracts 2 million daily listeners. Based on this trend, DW's Brazilian department started its own daily news podcast in August 2020. While the monthly usage rises consistently with more than 50.000 impressions in December 2020, it becomes equally clear how resource-intensive its production is.

DW expects that the demand for news podcasts in other languages will rise. Consequently, it is highly desirable to be able to produce audio news content in one of DW's other 29 (soon 31) languages with a short ramp-up time and with minimal personnel effort.

### ***Concept***

We want to build an application to support journalists in the Brazilian department to produce daily audio news bulletins by automating some of the tasks involved. The Brazilian News Bulletin, on average 6 minutes long, is structured as follows:

Introduction, followed by 5 news stories, followed by an outro.

The editorial department scans several sources (both internal to DW as well as other broadcast or press agency material) to compile the stories. Examples are: <https://www.dw.com/pt-br/not%C3%ADcias/s-7111>, <https://www.dw.com/en/germany-third-conservative-mp-quits-as-pressure-grows-over-lobbying-scandals/a-56843514>

### Targeted Platforms

The bulletins are delivered to 8 platforms:

Table 2: Targeted platform for the news podcast creation

| Platform           | Access   |
|--------------------|--|
| Spotify            | <a href="#">Link</a> to spotify.com  |
| DW's Media Center  | <a href="#">Link</a> to dw.com   |
| Apple Podcast      | <a href="#">Link</a> to Apple Podcast Platform                                       |
| Google Podcast     | <a href="#">Link</a> to Google Podcast Platform                                      |
| YouTube            | <a href="#">Link</a> to YouTube playlist<br><a href="#">Link</a> to YouTube RSS-Feed |
| Amazon Alexa       | <a href="#">Link</a> to Alexa Store  |
| Google Assistant   | <a href="#">Link</a> to Google Action Store in Brazilian                             |
| Facebook Messenger | <a href="#">Link</a> to Facebook Messenger   |

### Production Steps

The manual production of a single news bulletin can be subdivided into the following steps:

Table 3: Production steps of a single news bulletin

| Step | What  |
|------|---|
| 1    | Research 5 stories  |
| 2    | Write 5 stories   |
| 3    | Check stories by colleague                                    |
| 4    | Record, edit, upload into the system                          |
| 5    | Add metadata in CMS, create YouTube video, publish on YouTube |

*Where could SELMA support the production?*

Below is a proposed overview of the workflow, involving a number of AI components integrated into SELMA, that could be used to support the journalist with the aim to increase efficiency. Most likely, SELMA needs to be coupled with a variety of other systems, such as

- Podcast production platforms
- feed generators
- the DW CMS
- Social Media platforms (YouTube, Instagram, TikTok, ...)

It remains to be defined which steps should be carried out by SELMA and which steps by external systems. Once the split-up is defined, the appropriate interfaces need to be looked at, including the associated APIs.

*Step 1: Research*

- SELMA should be used to identify a configurable number of suitable storylines and propose them to the journalist.
- The individual storylines should be identified
  - by a title,
  - an abstract summary,
  - a list of the sources that report on the storylines
  - statistics that illustrate why the storyline is judged to be relevant
- The storylines should be ranked by relevance
- The considered time period should be configurable, e.g. 'the last 6 hours' or 'the last 12 hours'
- The system should be able to judge the newsworthiness of considered storylines based on several observations, amongst them:
  - the number of related stories published during the observation period
  - the change (first derivative) of the number of related stories published during the observation period with respect to preceding observation periods
- The journalist should be able to choose the storylines she or he wants to include in the news bulletin

### Step 2: Writing stories

- For each of the selected storylines, the system should be able to produce a first draft of a related news report using summarization techniques
- The draft news report should be configurable:
  - number of words / duration if read out aloud by an average news reader / by average news readers
- the type of news report - should be read by a single news reader in a more formal (neutral) style or possibly by two readers in a more casual style
- The draft report should be editable by one or more journalist(s)

### Step 3: Checking Stories

- The journalist should be able to store the edited text in a structured format at a central location where colleagues can provide feedback
- Once the texts are checked, the journalist should be made aware of that fact

### Step 4: Recording, editing, upload into the system

- The journalist should be able to choose whether to record the bulletins with her or his own voice or automatically, via voice synthesis
- The system should be able to add intro, background and outro music automatically, possibly in conjunction with an external podcast production system
- The journalist should be able to edit the result, for example to adjust the individual levels and duration of the segments
- The export of the final audio track should be possible with the touch of a button

### Step 5: Add metadata in CMS, create social video, publish

- The system should generate automatic metadata where possible:
  - title
  - short description
  - playlist with timestamps
  - publication date
- The system should be able to publish to various platforms automatically, via RSS feeds that it generates

- The system should be able to produce a video containing the audio track with a single fixed image
- As an alternative, the system could offer the possibility to add an image to each segment of the news podcast and create the corresponding video
- The system should be able to upload the video to YouTube
- As an extension, the system could be able to produce additional videos with short duration ( $\leq 1$  minute or even 30 seconds) for platforms such as TikTok, or Instagram Reels
- Another extension would be to produce image tiles with audio, to be assembled into Instagram Stories

#### Step 6: Create Social Media Links

- The system could create template texts that could be posted on Social Media (Twitter & Facebook) via copy & paste

This application will allow journalists to automate some of the steps, standardize and make the process much more efficient, while keeping full editorial control over the final output.

### 3.2.2 Video Subtitling

This section describes a DW use case application where SELMA output is further processed as subtitles.

#### **Goal**

The system creates subtitles based on the audio track, potentially translates them and makes them available for manual editing. Subsequently, it applies them to the video.

#### **Concept**

We start from content that comes from the SELMA monitoring use case. In that output, the user may find a video of interest for further publication with subtitling in source language or in another language.

#### Step 1: Select video item

- The system allows the user to select one or more videos from the SELMA monitoring output (use case 1) – or possibly from another source- and send it to a module that allows further processing of selected items

Step 2: Apply ASR and manually correct transcription in original language

- The user applies automated speech recognition (ASR) or uses the ASR output that was used during the monitoring phase. The system may use third-party services for this
- The user corrects the ASR output manually. This provides a correct text transcription in the source language
- User corrections are analyzed by the system and used to train the system at different levels

Step 3: Select target language, apply MT and manually correct translation

- The user selects a target language of his/her choice from the languages available in the system
- The system applies machine translation (MT). The system may use third-party services for this
- The user corrects the MT output manually. This provides a correct text translation in the target language
- User corrections to the MT output are analyzed by the system and used to train the system at different levels

Step 4: Apply subtitling

- Subtitles are produced using a separate module
- The transcription is shown as synchronized subtitles in the source language
- The translation is shown as synchronized subtitles in the selected target language(s)

### 3.2.3 Video Voice-Over

This section describes a use case application where SELMA output is further processed as voice-over.

**Goal**

The extracted and edited subtitles are converted into an audio track via text-to-speech. The audio track is subsequently added to the video.

### ***Concept***

We use the same procedure as in the subtitling use case application, and follow the steps outlined there. In addition, we use a synthetic voice to produce a voice-over. The objective is to make the speech output in the target language as expressive and natural as possible, resembling the expressiveness of the original version.

A possible extension of this use case application is to apply the speech-to-speech translation module that is part of experimental research in WP3.

#### ***Step 1: Select video item***

- See subtitling use case application for details

#### ***Step 2: Apply ASR and manually correct transcription in original language***

- See subtitling use case application for details

#### ***Step 3: Select target language, apply MT and manually correct translation***

- See subtitling use case application for details

#### ***Step 4: Apply subtitling***

- See subtitling use case application for details

#### ***Step 5: Apply voice-over***

- Voice-over is produced through a separate module using speech synthesis
- The user selects the preferred voice from the list of available voices
- SSML (speech synthesis markup language) may be applied to further correct and optimize the synthetic voice output
- An audio or video file can be downloaded with the target voice output

## 4. Personae

This section presents the personae applicable to the SELMA project in relation to broadcast monitoring and news production, as well as press agency monitoring. This section details the personae, their role and relationship.

### 4.1 Broadcast monitoring and news production

In this section, we focus on use cases as applied to DW. Five personae have been identified by DW and defined (see table below).

*Table 4: DW Personae relevant to SELMA*

| Persona ID | Role                        | Organization          | Relationships  |
|------------|-----------------------------|-----------------------|--|
| DW P1      | Editor-in-Chief             | Programme Directorate | Leads overall DW production team   |
| DW P2      | Head of Region              | Regional Department   | Represents DW language departments belonging to a particular region                            |
| DW P3      | Head of Language Department | Language Department   | Leads a specific DW language department  |
| DW P4      | Journalist                  | Language Department   | Reports to Head of Language Department<br>Produces content for a specific language requirement |

|       |        |                     |                                  |
|-------|--------|---------------------|----------------------------------|
| DW P5 | Editor | Language Department | Writes, edits or reviews content |
|-------|--------|---------------------|----------------------------------|

## 4.2 Press Agency monitoring

In this section, 6 personae have been identified by Priberam and defined (see table below).

*Table 5: Priberam Personae relevant to SELMA*

| <b>Persona ID</b> | <b>Role</b>                    | <b>Organization</b>  | <b>Relationships</b>  |
|-------------------|--------------------------------|----------------------|---|
| PBA P1            | Sales Rep                      | Press Agency         | Sells services (mainly to Media Publishers)                 |
| PBA P2            | Head of Business Development   | MMO                  | Monitors company, competitors and business-related subjects |
| PBA P3            | CEO                            | SME                  | Monitors company, competitors and business-related subjects |
| PBA P4            | Head of Marketing and Commerce | Medium/Large Company | Monitors company, competitors                               |
| PBA P5            | Analyst                        | Government agency    | Monitors a number of industries and markets                 |
| PBA P6            | Communication Manager          | Industrial cluster   | Monitors specific industry for associates                   |

## 5. Workflows

This section presents the workflow diagrams for the two main use cases, media monitoring and news production. These provide an overview of the process for each case. The diagrams are divided into system and user actions.

### 5.1 Media monitoring

In the Media Monitoring use case, the system ingests preselected feeds and performs the necessary steps to provide the user with a result in line with his preferences. These steps include NLP processing of the media items, clustering and indexation. Resulting data is used for returning search results, alerts or translation of individual items.

The user can access items through different user interfaces/visualizations:

- *Storylines*, where news items are aggregated into clusters
- *Trending*, where the user is presented with the trending topics based on filters (date, feed, etc...)
- *Panels*, where the user can curate and discover relevant documents
- *Search/Views*, where the user can search and filter through the contents
- *Dashboards* where the system returns a series of visualizations to the user based on specific parameters

The user can then select any individual item, access its details and perform several actions on the item (e.g., mark as read/unread, translate and save). Finally, the user can produce an output under the form of a report, a dashboard, a *view* or a *panel*. The output can then be shared within the platform, exported to other systems or to the News Production use case.

This workflow is illustrated in more details in Figure 1.

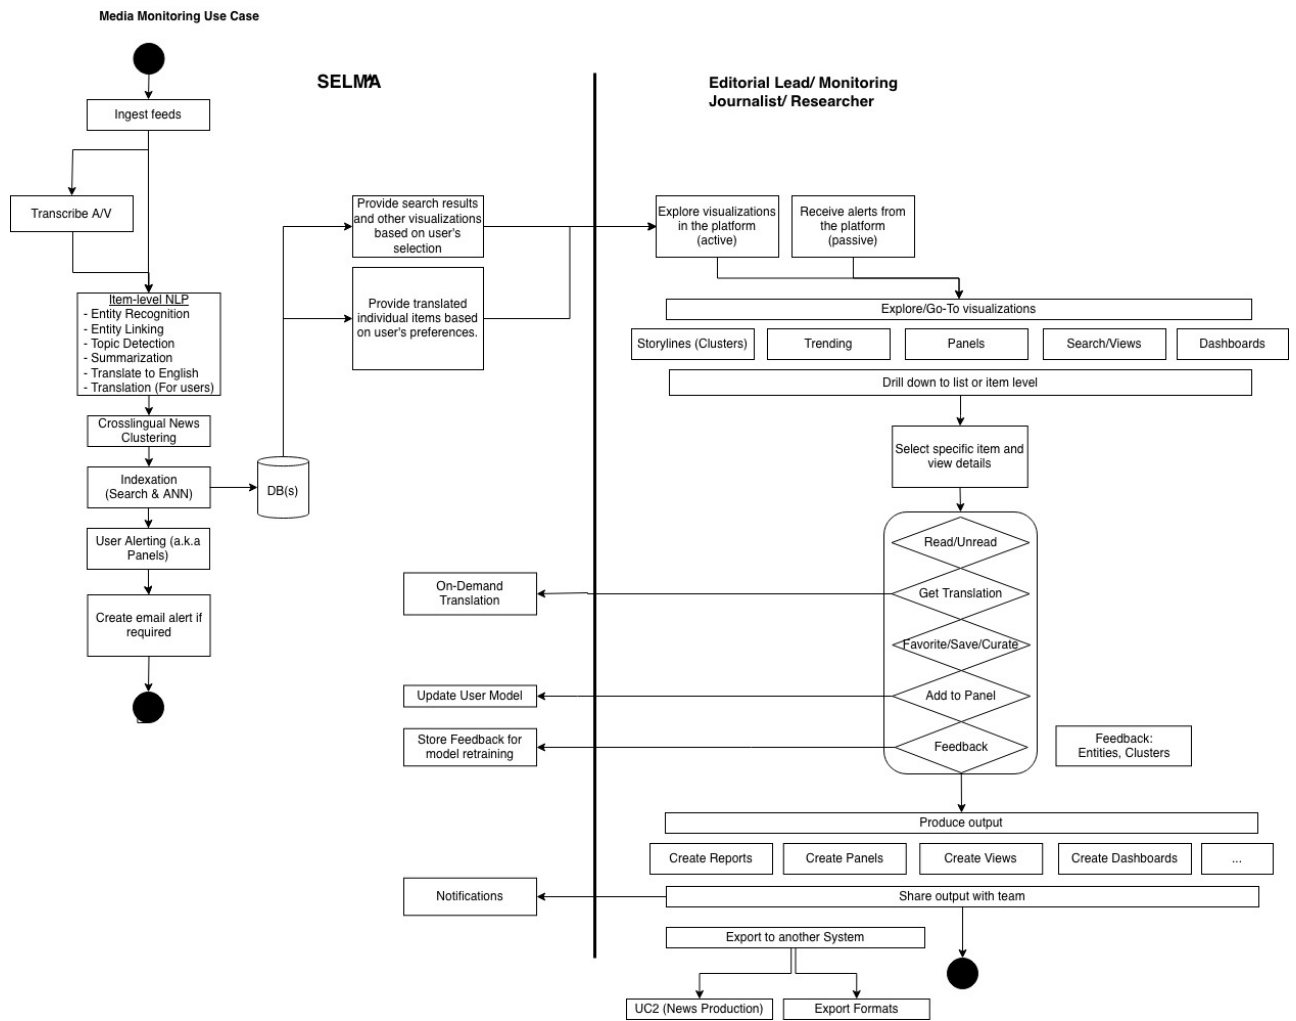

Figure 1: Workflow diagram for the UC: Media Monitoring

## 5.2 News production

The workflow for the News Production use case is built upon the workflow of Media Monitoring use case, described in the previous section. Here, the user can decide to upload an item or to select an item from the Media Monitoring use case for editing. The user can then request a transcription, translation, subtitling and/or voiceover for an individual media item. The user can edit the transcription, translation and subtitling text. Preferences regarding the engines used, options and voice-over customization can also be selected. Finally, the user can download the media item. Edits made on the transcription and translation text are used for re-training purposes by the system.

These steps are illustrated in more detail in the workflow diagram in Figure 2.

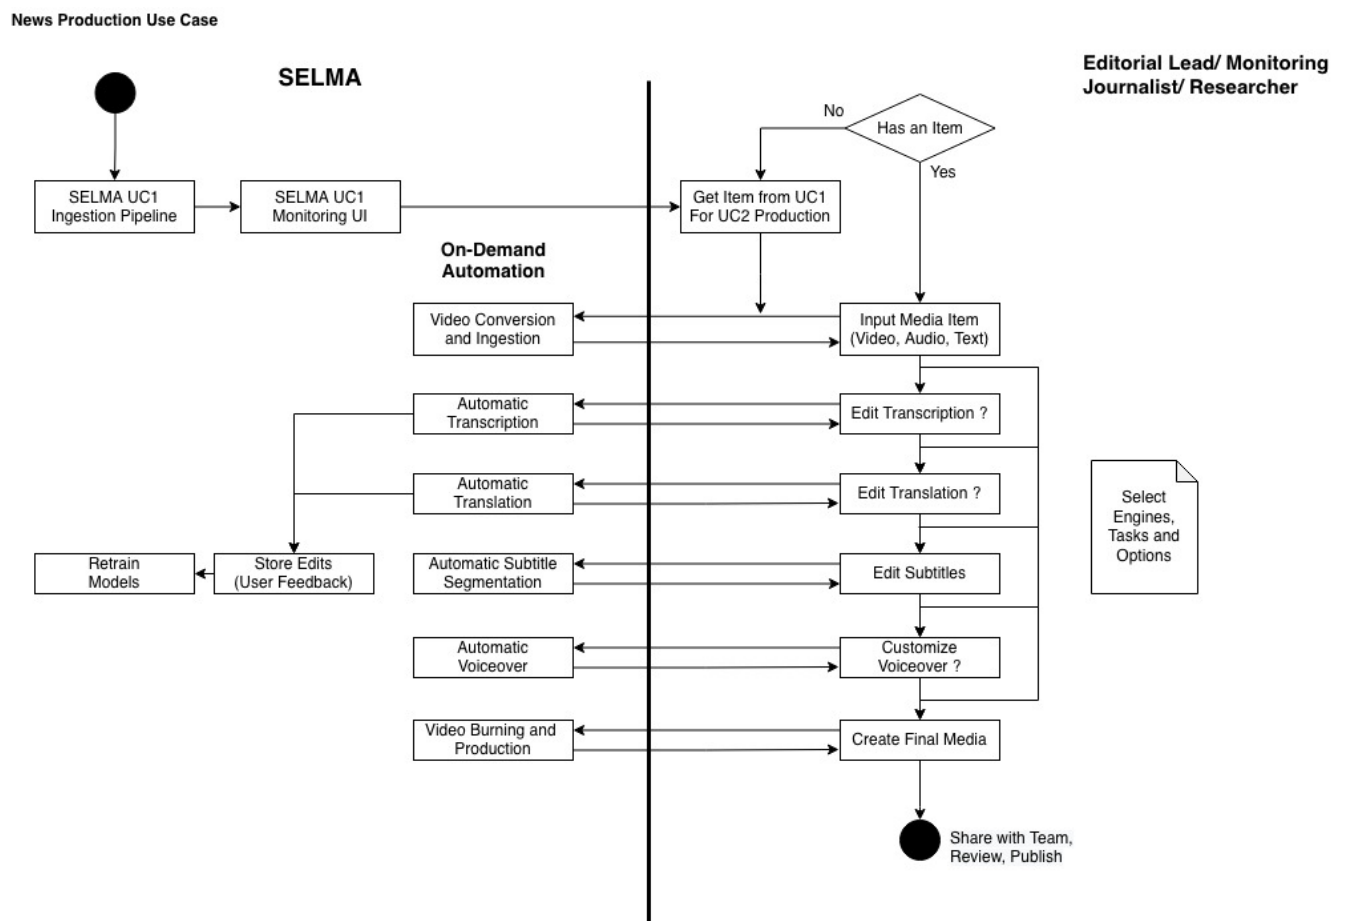

Figure 2: Workflow diagram for the UC: News Production

## 6.Scenarios

Based on the personae and workflow descriptions described previously, there are several functional areas that can be identified as being relevant to SELMA. The Scenario Model defines these scenarios and their interaction with both SELMA and the relevant personae, whilst the individual scenario descriptions define the functional path within each of these scenarios.

### 6.1 Overview

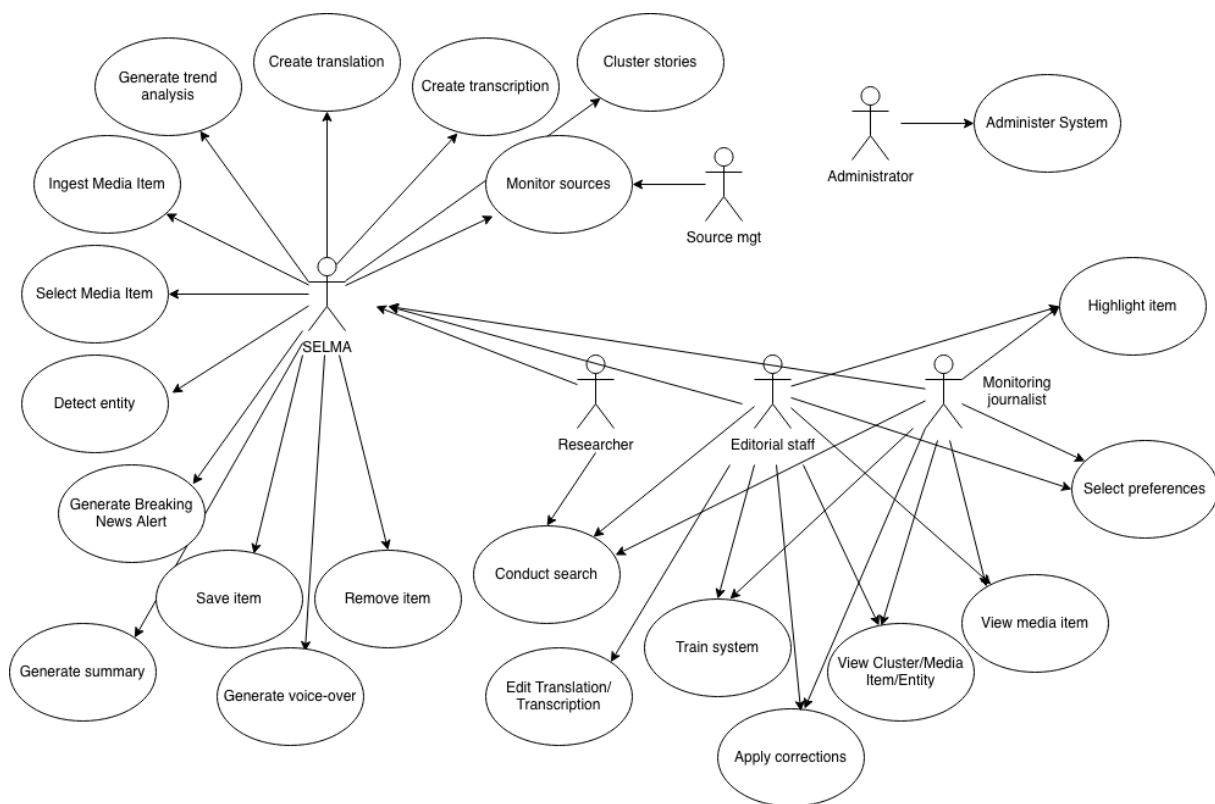

Figure 3: Scenario model

## 6.2 Detailed descriptions

Detailed in this section are 22 user scenarios, each describing a specific activity/step in the targeted use cases. The individual functional scenarios are defined as follows:

- 1- Monitor Sources
- 2- Ingest Media Item
- 3- Select Media Item
- 4- Detect and Link Entity
- 5- Generate Breaking News Alert
- 6- Create Transcription
- 7- Create Translation
- 8- View Cluster/ Entity
- 9- View Individual Media Item
- 10- Select Preferences
- 11- Conduct Search
- 12- Save Cluster/ Individual Media Item
- 13- Remove Item
- 14- Train System
- 15- Highlight Item
- 16- Generate Trend Analysis
- 17- Administer System
- 18- Group Media Items into Clusters
- 19- Generate Summary
- 20- Generate Voice-Over
- 21- Edit Transcription/ Translation
- 22- Apply Corrections

## 7.Requirements

The following tables list the requirements for the SELMA system, as they can currently be foreseen. The overall requirements have been extracted from the workflows and scenarios, and have been divided into User requirements and Technical requirements.

They have been prioritized in collaboration with the technical partners, in terms of need, challenge and feasibility. The MosCow method has been used for prioritization (Must - Should - Could - Won't).

Each requirement has been assigned a value as following:

- *Must*: the requirement is non-negotiable, and the product is not viable without it
- *Should*: the requirement is important, but not vital for the product
- *Could*: the requirement is wanted/ desirable, but is less important than a *Should*
- *Won't*: the requirement will not be delivered

Each requirement has been assigned to the Media Monitoring use case or the News Production use case, as appropriate.

### 7.1 User requirements

Table 6: User requirements for SELMA

|   | Requirements   | Use Case | MoSCoW |
|---|--|----------|--------|
| 1 | The System allows content to be ingested via standard interfaces as used by news organizations where available | 1        | Must   |
| 2 | It is possible to use APIs to add content to the SELMA platform  | 1, 2     | Should |
| 3 | The System ingests on-demand AV content in MP4 format  | 1,2      | Must   |
| 4 | The System monitors selected social media feeds  | 1        | Should |
| 5 | The System scrapes news articles from websites   | 1        | Must   |

| Module Functionality |  |      |        |
|----------------------|--|------|--------|
| 6                    | The system processes content in the 30+ SELMA languages  | 1, 2 | Must   |
| 7                    | The system transcribes from audio  | 1,2  | Must   |
| 8                    | The system provides statistical analysis of ingested material  | 1    | Must   |
| 9                    | The system provides automated translation of all SELMA languages into English as default   | 1    | Should |
| 10                   | The system provides automated translation into other SELMA languages upon request  | 1, 2 | Should |
| Output               |  |      |        |
| 11                   | The system offers the possibility to create dashboard user interfaces  | 1    | Should |
| 12                   | The system provides a summarization of individual media items in original language and/or English  | 1    | Must   |
| 13                   | User selects ingested channels to monitor  | 1    | Must   |
| 14                   | User subscribes to notifications when relevant content arrives   | 1    | Must   |
| Content              |  |      |        |
| 15                   | The system uses clustering technology to group individual media items into over-arching high-level clusters  | 1    | Must   |
| 16                   | The system provides a visualization which contains a list of all high-level news stories that are relevant to the user, according to the preferences they have set | 1    | Must   |
| 17                   | On detection of a high-level news story, the system provides a default name for this story based on the clustering technology parameters                           | 1    | Could  |

|                            |  |   |       |
|----------------------------|--|---|-------|
| <b>18</b>                  | The system offers the user the ability to follow a specific story and subscribe to updates regarding that story  | 1 | Could |
| <b>19</b>                  | The system allows the user to select a high-level news story and view the individual media items that are relevant to it   | 1 | Must  |
| <b>20</b>                  | For each high-level news story, the system displays a timeline. The system indicates where each individual media item fits on that timeline  | 1 | Could |
| <b>21</b>                  | When viewing an individual media item, the user has the ability to link back to the over-arching high-level news story to which it is related (in order to view the other media items related to that cluster) | 1 | Must  |
| <b>22</b>                  | The individual media items for a cluster continue to accrue for a selected period of time. However, the user can indicate to the system that the cluster is no longer relevant before this time has elapsed    | 1 | Could |
| <b>23</b>                  | The system retains a record of clusters that it has identified along with an indication of how many media items were identified by the system  | 1 | Must  |
| <b>Entity Requirements</b> |  |   |       |
| <b>24</b>                  | The system uses entity identification technology to group individual media items by entities   | 1 | Must  |
| <b>25</b>                  | For each selected entity, the system displays a timeline   | 1 | Must  |
| <b>26</b>                  | The system carries out entity identification (person, organization, locations and events) using the original language and/or English translation   | 1 | Must  |

|   |  |   |        |
|---|--|---|--------|
| 27                                      | The system provides a list of identified entities that are relevant to the user, according to the preferences they have set  | 1 | Must   |
| 28                                      | The system allows the user to highlight an entity identified by the system and view the individual media items that include the entity   | 1 | Must   |
| 29                                      | When viewing an individual media item, the user can link back to the entity to which it is related (in order to be able to view the other media items related to that entity)                | 1 | Could  |
| 30                                      | The system retains a record of entities identified along with an indication of how many media items were identified as relating to those particular entities                                 | 1 | Must   |
| <b>News Story Requirements</b>          |  |   |        |
| 31                                      | The system uses preferences set by the user to detect news stories of interest to the user   | 1 | Must   |
| 32                                      | For each cluster, the system displays a timeline. The system indicates where each individual media item fits on that timeline  | 1 | Should |
| <b>Breaking News Alert Requirements</b> |  |   |        |
| 33                                      | The system provides breaking news alerts that will correspond to individual media items in accordance with the preferences set by the user   | 1 | Must   |
| 34                                      | A breaking news alert consists of a textual description of the associated media item in the original language and/or in English, along with some specified meta-data (such as date and time) | 1 | Must   |

|  |  |      |       |
|--|--|------|-------|
| 35                                     | The user selects their preferences for the type of clusters for which they wish to receive alerts (this may be related to particular event or entity types)                                | 1    | Must  |
| 36                                     | The user selects the manner and frequency at which they receive event alerts   | 1    | Must  |
| 37                                     | Breaking news alerts are as close to live as is technically possible   | 1    | Must  |
| <b>General Functional Requirements</b> |  |      |       |
| 38                                     | The system monitors all input sources selected by the user   | 1    | Must  |
| 39                                     | The user can turn English translation on or off  | 1    | Must  |
| 40                                     | It is possible to associate a user with their team in the System   | 1, 2 | Must  |
| 41                                     | It is possible to indicate the role of a user in the System  | 1, 2 | Could |
| 42                                     | A user can share a cluster or an individual media item with their team   | 1    | Must  |
| 43                                     | Once a user has indicated that a particular news story or cluster is no longer relevant, individual media items relating to that entity or cluster can be removed from the user's view     | 1    | Must  |
| 44                                     | The user can flag a particular individual media item, entity or cluster and its related media items and indicate that they wish to save them for future reference                          | 1    | Must  |
| 45                                     | The user has an option in the system where they can view individual media items, entities or clusters which they chose to save (alongside all the individual media items related to these) | 1    | Must  |
| <b>Media Item Requirements</b>         |  |      |       |

|                                     |   |      |       |
|-------------------------------------|---|------|-------|
| 46                                  | The system provides a clear visual indicator as to the nature of an individual media item (social media, blog, website, AV etc.)  | 1    | Must  |
| 47                                  | The user can view the detail of an individual media item (when applicable)  | 1    | Must  |
| 48                                  | For an individual AV media item, the user views the video and its original transcription, a translation in the prespecified languages (where applicable) and the meta-data associated with the item | 1, 2 | Must  |
| 49                                  | For individual AV media items, the system supports a player and editor with tools to 'scrub' through the video, rewind and download   | 1, 2 | Must  |
| 50                                  | For individual AV media items, the system supports a player and editor with tools to select elements to 'clip'  | 1, 2 | Could |
| 51                                  | It is possible for the user to 'clip' an individual AV media item by means of text selection from the transcript  | 1, 2 | Could |
| 52                                  | For other media occurrences (i.e. textual), the user views the text, its translation in the prespecified language (where applicable) and any meta-data associated with the item                     | 1, 2 | Must  |
| 53                                  | The system provides a 'confidence level indicator' which will indicate how strongly an individual media item relates to the existing or suggested clusters  | 1    | Must  |
| <b>User Preference Requirements</b> |   |      |       |
| 54                                  | It is possible to set up a set of default sources that will be frequently used by a particular team   | 1, 2 | Must  |
| 55                                  | The system contains a predefined list of sources by region  | 1    | Must  |

|                                    |  |      |        |
|------------------------------------|--|------|--------|
| 56                                 | The user can specify entities of particular interest to them   | 1    | Must   |
| 57                                 | The user can choose their region of interest in the System   | 1    | Must   |
| 58                                 | The user can prioritize countries of interest within their region of interest  | 1    | Must   |
| 59                                 | The system contains a predefined list of regions and countries   | 1    | Must   |
| 60                                 | It is possible for the user to set time parameters in the system using an indicator such as a time slider to indicate the time period in which they are interested   | 1    | Must   |
| 61                                 | In general, the system supports input of preferences in a number of ways: From predefined lists, using data being encountered in the system (the system will create new entities, events etc.), using free-format text (i.e. search boxes) | 1    | Must   |
| 62                                 | The system is adaptable and configurable to the user's preferences   | 1    | Should |
| <b>Administration Requirements</b> |  |      |        |
| 63                                 | The user can log into the system   | 1, 2 | Must   |
| 64                                 | The user can log out of the system   | 1, 2 | Must   |
| 65                                 | The system supports a super user account   | 1, 2 | Must   |
| 66                                 | The system supports an administrative user (for account management)  | 1, 2 | Must   |
| 67                                 | The administrator can create teams in the system   | 1, 2 | Should |
| 68                                 | The administrator has typical administrator rights including add new user, remove users, update user profiles as well as the ability to manage data held by the System   | 1, 2 | Should |

| Search Requirements       |   |      |       |
|---------------------------|---|------|-------|
| 69                        | It is possible for the user to conduct a search based on an entity or entities  | 1    | Must  |
| 70                        | It is possible for the user to search based on the type of the media item (e.g. social media, AV etc.)  | 1    | Must  |
| 71                        | It is possible for users to search based on event types   | 1    | Won't |
| 72                        | It is possible to take a screen shot (or still frame) from an individual AV media item (rights to be considered here)   | 1, 2 | Could |
| 73                        | Entity search is able to handle a range of variable spellings for the same entity   | 1    | Must  |
| 74                        | It is possible to train the system in relation to alternative spellings for searches. For example, it should be possible to link to alternative spellings and indicate that they relate to the same thing | 1    | Won't |
| Input Source Requirements |   |      |       |
| 75                        | The system informs the user if a source stops broadcasting  | 1    | Could |
| 76                        | The system informs the user if the frequency at which a channel is broadcast, changes   | 1    | Could |

| Trend Analysis Requirements |  |   |       |
|-----------------------------|--|---|-------|
| 77                          | The user has the ability to set their preferences in the system with regard to the types of trend analysis they wish to see in the system  | 1 | Must  |
| 78                          | The system offers the user various options around trend analysis including maps incorporating hotspots, graphs and timelines showing hotspots                                    | 1 | Must  |
| 79                          | The system utilizes saved clusters and media items (that the system has saved along with the number of media items) to conduct trend analysis over a period longer than one week | 1 | Could |
| Generate Voice-Over         |  |   |       |
| 80                          | The system generates a voice-over on request for individual AV media items   | 2 | Must  |
| 81                          | The user chooses whether the voice-over is performed in the original or in the selected translation language   | 2 | Must  |
| 82                          | The system provides a list of available synthetic voices for the user  | 2 | Must  |
| 83                          | The user can choose and/or change which synthetic voice is used for the voice-over   | 2 | Must  |
| 84                          | The user can change the synthetic voice per segment  | 2 | Must  |
| 85                          | The user can amend the voice-over output including phonetics, pauses and pitch   | 2 | Could |

| <b>Edit Transcription/Translation</b>    |   |      |        |
|--|---|------|--------|
| <b>86</b>                                | The user can edit the transcribed text  | 2    | Must   |
| <b>87</b>                                | The user can edit the translated text   | 2    | Must   |
| <b>88</b>                                | The user saves the edited versions of the transcribed and/or translated text  | 2    | Must   |
| <b>89</b>                                | The user changes the engine and perform the transcription again for the whole text and/or by segment  | 2    | Should |
| <b>90</b>                                | The user changes the engine and perform the translation again for the whole text and/or by segment  | 2    | Should |
| <b>System Learning and User Feedback</b> |   |      |        |
| <b>91</b>                                | The system is trained by the user. The system offers the user a selection of news stories and individual media items relevant to a cluster and the user accepts/rejects them as necessary, thus training the system | 1    | Must   |
| <b>92</b>                                | The system is trained by the user. The system offers the user breaking news alerts and the user accepts/rejects as necessary – training the system to meet the user’s preferences                                   | 1    | Must   |
| <b>93</b>                                | The system learns from the user's corrections and apply them throughout the text  | 2    | Must   |
| <b>94</b>                                | The system applies corrections on different levels (current and future items) based on the preferences set by the user  | 1, 2 | Should |
| <b>95</b>                                | The system learns from the user's corrections for entities  | 1, 2 | Must   |
| <b>Diversity Detection</b>               |   |      |        |

|            |   |   |        |
|------------|---|---|--------|
| <b>96</b>  | The system identifies the binary gender associated with the author's name (if present) of an individual media item  | 1 | Should |
| <b>97</b>  | The system provides the number of times each binary gender is mentioned in the media items  | 1 | Must   |
| <b>98</b>  | The system identifies the gender of the protagonist in each individual media item (if applicable)   | 1 | Should |
| <b>99</b>  | The system provides the number of times each binary gender is mentioned in each topical cluster   | 1 | Must   |
| <b>100</b> | The system provides a visualization of the gender analysis  | 1 | Must   |
| <b>101</b> | The system provides all information pertaining to the diversity data (gender, age, sexual orientation, country of citizenship, medical condition) found on the Wikidata entry of relevant public figures where applicable | 1 | Must   |
| <b>102</b> | The system identifies the gender associated with the named entities of type person, even if the gender information is not available in Wikidata (or the entity is not in Wikidata at all)                                 | 1 | Should |

## 7.2 Technical requirements

Table 7: Technical requirements for SELMA

|                                 | Requirements   | Use Case | MoSCoW |
|---------------------------------|--|----------|--------|
| <b>Platform - Orchestration</b> |  |          |        |
| P1                              | Orchestrates processing jobs on the data stream, automatically   | 1        | Must   |
| P2                              | Orchestrates processing jobs on the data stream, on user request   | 1,2      | Must   |
| P3                              | Allows listening for job results via push notifications (e.g, web sockets)   | 1,2      | Should |
| P4                              | Allows listening for job state changes (errors, job progress)  | 1,2      | Must   |
| P5                              | Allows consulting the state of a job request / jobs on an item via an API (e.g., REST)   | 1,2      | Must   |
| P6                              | Accepts new “job workflow” requests, which may entail running several jobs organized in a graph of dependencies, on an item    | 1,2      | Must   |
| P7                              | Orchestrated jobs are eventually applied, meaning, a job cannot be lost - it is either completed successfully or logs an error | 1,2      | Must   |
| P8                              | Orchestration-related configuration changes happen without downtime  | 1,2      | Could  |
| P9                              | Resilience to the unavailability / downtime of specific workers. Jobs wait until the worker recovers                           | 1,2      | Should |

|  |   |     |        |
|--|---|-----|--------|
| P10  | The system allows parallel jobs to execute on the same item if they can be run that way according to the orchestrated job graph | 1,2 | Could  |
| <b>Platform - Worker management</b>        |   |     |        |
| P11  | Processing workers use Docker (or equivalent) containerization for deployment   | 1,2 | Must   |
| P12  | The system is prepared for kubectl-compatible deployment in Kubernetes clusters   | 1,2 | Should |
| P13  | The system manages the lifetime of different worker containers  | 1,2 | Could  |
| P14  | The system scales the number of worker containers according to the corresponding task queue flux                                | 1,2 | Could  |
| P15  | Worker-related configuration changes (new workers, worker scaling, etc.) happen without downtime                                | 1,2 | Could  |
| <b>Platform - Replication and Sharding</b> |   |     |        |
| P16  | The system allows replication at the worker level   | 1,2 | Must   |
| P17  | The system allows replication at the orchestration controller level   | 1,2 | Should |
| P18  | The system allows replication at the database level   | 1,2 | Should |
| P19  | The system allows sharding at the orchestration controller level  | 1,2 | Should |
| P20  | The system allows sharding at the database level  | 1,2 | Should |

| Component - Online News Classification and Clustering |  |     |        |
|---|--|-----|--------|
| <b>C1</b>   | For each ingested news item, the system attributes a cluster   | 1   | Must   |
| <b>C2</b>   | For each ingested news item, the system attributes an IPTC topic                                       | 1   | Must   |
| <b>C3</b>   | The system clusters documents in an online fashion, e.g., without having to revisit all past decisions | 1   | Must   |
| <b>C4</b>   | The system clusters documents natively in all 30 SELMA languages                                       | 1   | Should |
| <b>C6</b>   | The system leverages user feedback on clustering decisions to improve future decisions                 | 1   | Should |
| Component - Summarization                             |  |     |        |
| <b>S1</b>   | For each ingested news item, the system generates a summary  | 1   | Must   |
| <b>S2</b>   | The system generates summaries natively in all 30+ SELMA languages                                     | 1   | Should |
| <b>S3</b>   | The system generates summaries either from original text article or video transcripts                  | 1   | Should |
| <b>S4</b>   | The system leverages user feedback on summarization results to improve future summaries                | 1   | Should |
| Component - Machine Translation                       |  |     |        |
| <b>M1</b>   | The system translates a textual document by demand   | 1,2 | Must   |
| <b>M2</b>   | The system translates a video by demand  | 1,2 | Must   |

|   |   |     |        |
|---|---|-----|--------|
| <b>M3</b>   | The system translates between all 30+ SELMA languages   | 1,2 | Should |
| <b>Component - Automatic Transcription</b>        |   |     |        |
| <b>R1</b>   | The system automatically transcribes an ingested video or audio file  | 1,2 | Must   |
| <b>R2</b>   | The transcription is enriched by punctuation  | 1,2 | Must   |
| <b>R3</b>   | The transcription is enriched by speaker information  | 1,2 | Should |
| <b>R4</b>   | The transcription is enriched by named entity labeling  | 1,2 | Must   |
| <b>R5</b>   | The system transcribes all 30 SELMA languages   | 1,2 | Should |
| <b>Component - Entity Recognition and Linking</b> |   |     |        |
| <b>E1</b>   | For each ingested news item, the system detects named entities  | 1   | Must   |
| <b>E2</b>   | For each ingested news item, the system links named entities to a knowledge base                                    | 1   | Must   |
| <b>E3</b>   | The system links entities natively in all 30 SELMA languages, leveraging crosslingual representations               | 1   | Should |
| <b>E4</b>   | For each ingested news item, the system attributes a gender for each person named entity detected in the news item. | 1   | Should |
| <b>Component - Story Segmentation</b>             |   |     |        |
| <b>G1</b>   | Each ingested long audio segment gets split into meaningful units   | 1,2 | Could  |
| <b>G2</b>   | Speaker clustering is used to create speaker independent units  | 1,2 | Could  |

|   |   |     |        |
|---|---|-----|--------|
| <b>G3</b>                                     | Speaker recognition automatically identifies the original speaker in each segment   | 1,2 | Could  |
| <b>G4</b>                                     | Topic segmentation is used to separate by spoken content  | 1,2 | Could  |
| <b>Component - Voice Conversion Synthesis</b> |   |     |        |
| <b>V1</b>                                     | The text-to-speech system automatically produces voices in Latvian, German, and French  | 2   | Must   |
| <b>V2</b>                                     | The text-to-speech system will be improved to better handle foreign words   | 2   | Must   |
| <b>V3</b>                                     | A speech-to-speech translation system works at least on one language pair   | 2   | Should |
| <b>V4</b>                                     | A speech-to-speech translation system works at least on one language pair and can generate a synthetic voice in the target language close to the natural voice in the source language | 2   | Could  |

## 8.Key Performance Indicators – KPIs

This section presents the KPIs for each main component of the system as identified by the technical partners. They will be used to measure the success of each component and to assess the progress throughout the project.

*Table 8: Key Performance Indicators for SELMA*

| Component                               | KPI  |
|---|--|
| <b>Platform - Ingestion Scalability</b> | Able to scale up to processing around 10M news articles/segmented video transcripts per day, given the computational resources.  |
| <b>Platform – User Scalability</b>      | The system should handle 500 simultaneous users for an installation of the platform.   |
| <b>Platform – Language Coverage</b>     | Processing models for Albanian, Amharic, Arabic, Bengali, Bosnian, Bulgarian, Chinese, Croatian, Dari, English, French, German, Greek, Hausa, Hindi, Indonesian, Kiswahili, Latvian, Macedonian, Pashto, Persian, Polish, Portuguese for Africa, Portuguese for Brazil, Romanian, Russian, Serbian, Spanish, Turkish, Ukrainian, Urdu. |

|  |   |
|--|---|
| <b>Component - Crosslingual Representations and Entity Linking</b> | We will evaluate the representations on downstream tasks that make use of them, such as entity linking and text classification. We seek to outperform scores of the state of the art on standard offline multi-pass methods, improving over 86.6 micro F1 scores on end-to-end linking on the CoNLL YAGo dataset (Kolitsas et al., 2018). |
| <b>Component - Summarization</b>                                   | We expect gains of at least 5% in ROUGE-1, ROUGE-2 and ROUGE-L F-scores over the state-of-the-art scores and improvements over 5% on factual correctness for abstractive summarization. A common dataset for evaluation is the CNN/DailyMail (Hermann et al., 2015) and New York Times dataset (NYT) (Sandhaus, 2008).                    |
| <b>Component - Clustering</b>                                      | We expect improvements of at least 5% in the F1 metric.   |
| <b>Component - Segmentation</b>                                    | We aim at an improvement of 10% relative of the Diarization Error Rate (Bredin 2017) over state-of-the-art segmentation systems such as pyannote or the segmentation provided by Kaldi (Povey 2011), measured on the in-domain data provided by Deutsche Welle.   |
| <b>Component - Speech Machine Translation</b>                      | The system will be able to offer 2 new language pairs thanks to the use of  |

|  |   |
|--|---|
|  | state-of-the-art end-2-end spoken machine translation approaches, especially for low resource speech translation.   |
| <b>Component - Automatic Transcription</b> | The SELMA ASR system will outperform state-of-the-art results on some high resource language benchmarks. For instance, for French, on the ETAPE benchmark dataset, a reduction of at least 5% of word error rate is expected. |

## 9. Conclusion

This document presents an overview of the preparatory work for defining the user requirements for the SELMA project, for the development of the two primary SELMA use cases, i.e., Media Monitoring and News Production.

The different personae describe the actors identified for both use cases by Deutsche Welle and Priberam. Two workflow descriptions are provided for each use case, with detailed diagrams.

A scenario model provides an overview of relationships between actors, activities and the platform. Twenty detailed user scenarios describe foreseen activities through interaction with the SELMA system.

A list of user requirements and technical requirements is the result of the preparatory work as described in this report. Together with the user scenarios, the workflow diagrams and the personae descriptions, these requirements form the basis for the use case applications and prototype development over the three years of the SELMA project. The input of this report (D1.1) will trigger the next phase, i.e., wireframing, mockups and prototyping as part of D1.2, in which these use case applications and scenarios will be implemented. This deliverable will be followed by three other reports in this series: D1.2 (Initial Prototype Report), D1.3 (Intermediate Prototype Report) and D1.4 (Final Prototype Report).
